Python Drill: PyDrill_Datetime_27_idle

Title: Datetime – Python 2.7 – IDLE

Scenario: The company you work for just opened two new branches. One is in New York City, the other in London. They need a very simple program to find out if the branches are open or closed based on the current time of the Headquarters here in Portland. The hours of both branches are 9:00AM - 9:00PM in their own time zone.

What is asked of you:

Create code that will use the current time of the Portland HQ to find out the time in the NYC & London branches, then compare that time with the branches hours to see if they are open or closed.

Print out if each of the two branches are open or closed.

Guidelines:

- Use Python 2.7 IDLE
- Use Datetime Module
- Execute program on the Shell

Once you have created the program, show it to your instructor for a pass.
